DNA strand transferase 2 - yeast (Saccharomyces cerevisiae)

NyAlternate names: DST2 protein; KEM1 protein; protein G1645; protein YGL173c; RAR5 pr
C;Species: Saccharomyces cerevisiae
C;Date: 16-Sep-1992 #sequence revision 16-Sep-1992 #text change 09-Jul-2004
C;Accession: S13743; S16701; S16885; S42156; S52457; A39790; S59238; S64190
C;Accession: S13743; S16701; Fink, G.R.
Genetics 126, 799-812, 1990
A;Title: kem mutations affect nuclear fusion in Saccharomyces cerevisiae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A;Accession: S13743

e.g. New testis-specific tubulin tyrosine-ligase-like BGS-42 polypeptide, useful for preventing, treating or ameliorating a medical condition, eaberrant cellular proliferation, reproductive disorders or testicular

Disclosure; SEQ ID NO 14; 343pp; English.

disorders.

```
This invention relates to a novel testis-specific tubulin tyrosine-ligase compared the BGS-42 polypeptide. The invention may be useful for the development of compounds with a cytostatic, respiratory gestrointestinal-Gen, neuroprotective, endocrine-Gen, respiratory cantinflammatory, anabolic, hypertensive, osteopathic, nootropic, antiparkinsonian, antiathritic, antiasthmatic, antiharty acting as tyrosine ligase modulators. In addition, the disclosed sequences may be tyrosine ligase modulators. In addition, the disclosed sequences may be tyrosine ligase modulators. In addition, the disclosed sequences may be useful for disponsing a pathological condition, the disclosed sequences may be compared to a pathological condition, such as a disorder related to aberrant cubulin ligase activity, a disorder related to aberrant tubulin.

CC ameliorating a medical condition, such as a disorder related to aberrant tubulin ligase activity, a disorder related to aberrant tubulin.

CC arboxypeptidase activity, aberrant cellular proliferation, reproductive disorders, testicular disorders, testicular cancer, pulmonary disorders, testicular disorders, testicular cancer, pulmonary disorders, concurs disorders, transcribity, aberrant cellular proliferation cof the testis, lung, small intestine, brain or lymph tissue. The BGS-42 polypeptide can be used as a preventive agent for immunological conservationing infertility, Cushing's syndrome, emphysema, pneumonia, Addison's disease, acromegaly, Alzheimer's disease, or Parkinson's disease. The BGS-42 polypeptides. The present sequence is that of the TIL1 domain of the human BGS-42 protein of the invention.

Example 4; SEQ ID NO 13; 343pp; English.

This invention relates to a novel testie-specific tubulin tyrosine-ligase
-like polypeptide, designated the BGS-42 polypeptide. The invention may
be useful for the development of compounds with a cytostatic, respiratory
cen, gastrointestinal-Gen, neuroprotective, endocrine-Gen,
antiparkinsonian, antiarthritic, antiasthmatic, anti-Har, antibacterial,
antiparkinsonian, antiarthritic, antiasthmatic, antibacterial,
immunosuppressive, antiseborrineic or dermatological activity acting as
tyrosine ligase modulators. In addition, the disclosed sequences may be
useful for gene therapy. The BGS-42 polypeptide or polymuclectide can be
useful for diagnosing a pathological condition or a susceptibility to a
pathological condition, such as a disorder related to aberrant
tubulin ligase activity, aberrant cellular proliferation, reproductive
carboxypeptidase activity, aberrant cellular proliferation, reproductive
disorders, testicular disorders, colon cancer, pulmonary disorders,
lung cancer, gastrointestinal disorders, colon cancer, promoch cancer,
neural disorders, brain cancer, liver cancer, pulmonary disorders,
cof the testis, lung, small intestine, brain or lymph tissue. The BGS-42
polypeptide, polymucleotide, or their modulators are also useful for
treating infertility, Cushings syndrome, emphysema, pneumonia, Addison's
disorders including arthritis, asthma, AIDS, sepsis, acne, signer, and
casses acroomegaly, Alaheimer's disease, or Parkinson's disease or sclenoderma. The antibodies may be used to purify, detect and
casses or sclenoderma. The antibodies may be used to purify, detect and
cancer the BGS-42 polypeptides. The present sequence is that of the
tubulin tyrosine ligase protein consensus sequence which was used in the tubulin tyrosine ligase protein coemplification of the invention.

carboxypeptidase activity, a disorder related to aberrant tubuling amedical condition, tuch as a disorder related to aberrant tubuling a cutivity, a disorder related to aberrant tubuling tubulin ligase activity, a disorder related to aberrant tubuling carboxypeptidase activity, activity and carboxypeptidase activity, activity and cancer, pulmonary disorders, lung cancer, pulmonary disorders, lung cancer, particular cancer, pulmonary disorders, lung cancer, liver cancer, or proliferative condition of the testis, lung, small intestine, brain or lymph tissue. The BGS-42 polypeptide, polymucleotide, or their modulators are also useful for treating infertility, Cushing's syndrome, emphysema, pneumonia, Addison's disease, acromegaly, Alzheimer's disease, or Parkinson's disease. The BGS-42 polypeptide can be used as a preventive agent for immunological disorders including archritis, asthma, AIDS, sepsis, acne, Sjogren's disease or scleroderma. The antibodies may be used to purify, detect and target the BGS-42 protein of the invention.

pathological condition in a subject, and for preventing, treating

This invention relates to a novel testis-specific tubulin tyrosine-ligase

-like polypeptide, designated the BGS-42 polypeptide. The invention may

be useful for the development of compounds with a cytostatic, respiratory

-Gen, gastrointestinal-Gen, neuroprotective, endocrine-Gen,

antinflammatory, anabolic, hypertensive, osteopathic, nootropic,

antingarkinsonian, antiathritic, antiasthmatic, anti-HIV, antibacterial,

immunosuppressive, antiseborrheic or dematological activity acting as

tyrosine ligase modulators. In addition, the disclosed sequences may be

cytosine ligase modulators. In addition, the disclosed sequences may be

cytosine ligase modulators. as useful to a subject, and for preventing, treating or

cused for disgnosing a pathological condition or a susceptibility to a

pathological condition in a subject, and for preventing, treating or

cused for disgnosing a pathological condition, such as a disorder related to aberrant

cused for disgnosing a medical condition, such as a disorder related to aberrant

completing a medical condition, such as a disorder related to aberrant

composition ligase activity, aberrant cellular proliferation, reproductive

disorders, testicular disorders, testicular cancer, pulmonary disorders,

lung cancer, gastrointestinal disorders, colon cancer, stomach cancer,

carboxypeptides activity, aberrant cellular proliferation cof the testis, lung, small intestine, brain or lymph tissue. The BGS-42

polypeptide can be used as a preventive agent for immunological

cy testing infertility, Cushing's syndrome, emphysema, pneumonia, Addison's

disease, acromegaly, Alzheimer's disease, or Parkinson's disease. The BGS-42

cy disease or scleroderma. The antibodies may be used to purify, detect and

cy disease or scleroderma. The present sequence is that of the human

cy polypetide can be used as a preventive agent to their purention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New testis-specific tubulin tyrosine-ligase-like BGS-42 polypeptide, useful for preventing, treating or ameliorating a medical condition, e.g. aberrant cellular proliferation, reproductive disorders or testicular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; SEQ ID NO 4; 343pp; English.

in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous injuries, peripheral nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, ancer disgnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leuksemias and sasays for receptor activity, arthritis and inflammation, leuksemias and C.N.S disorders. Note: The sequence data for this patent did not form
 immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein sequence SeqID2

This invention relates to a novel testis-specific tubulin tyrosine-ligase complete to the development of compounds with a cytostatic, respiratory to be useful for the development of compounds with a cytostatic, respiratory. Gen, gastrointestinal-Gen, neuroprotective, endocrine-Gen, antiinflammatory, anabolic, hypertensive, osteopathic, noctropic, antiinflammatory, anabolic, hypertensive, osteopathic, noctropic, antiinflammatory, anabolic, hypertensive, antiinflammatory, anabolic, hypertensive, antiinflammatory and antiseborrheic or dermatological activity acting as tyrosine ligase modulators. In addition, the disclosed sequences may be consetul for gene therapy. The BGS-42 polypeptide or polymucleotide can be used for diagnosing a pathological condition or a susceptibility to a cused for diagnosing a medical condition, such as a disorder related to aberrant tubulin-carboxypeptidase activity, a disorder related to aberrant tubulin-carboxypeptidase activity, aberrant cellular proliferation, reproductive carboxypeptidase activity, aberrant cellular proliferation, reproductive carboxypeptides activity, aberrant cellular proliferation, reproductive carboxypeptides prain cancer, liver cancer, scomach cancer, lung cancer, gastrointestinal disorders, colon cancer, scomach cancer, contained cancer, pulporated, polymecleotide, or their modulators are also useful for treating infertility, Cushing's syndrome, emphysema, pneumonia, Addison's disease, acromagaly, Alzheimer's disease, or Parkinson's disease. The BGS cateroderms including arthritis, asthma, AIDS, sepsis, acne, Sjogren's disease or acleroderman The antibodies may be used to purify, detect and target the BGS-42 polypeptides. The present sequence is that of the human cancer are appeared to the invention. Note: The present concerned by the present in the specification but was obtained from
                                                                                                                                                                                                                                New testis-specific tubulin tyrosine-ligase-like BGS-42 polypeptide, useful for preventing, treating or ameliorating a medical condition, eaberrant cellular proliferation, reproductive disorders or testicular
                                                                                                                                                                                                                                                                                                                                                                     Disclosure; SEQ ID NO 7; 343pp; English

The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and polypeptides; expression vectors and host cells comprising a TAT nucleic acids and antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosing of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with concreased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cancer, cancers of the central cancer, pancreatic cancer, cervical cancer, cancers of the central cancer manners and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in the present sequence
                                                                                                                    Tumour-associated antigenic target (TAT) polypeptide PRO80956, SEQ:1058.
                                                                                                                                                            antigenic target; TAT; human; overexpression; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New tumor-associated antigenic target polypeptides and nucleic acids, useful in preparing a medicament for treating or detecting a proliferative disorder, e.g. breast, lung, colorectal, ovarian or

osteopathic, cytostatic, anti-HIV, haemostatic, nephrotropic, antianaemic, antipsoriatic and hepatotropic activity. The polymucleotides cand the polypeptides of the invention can be used for gene therapy, protein replacement therapy and are useful for treating a variety of diseases or conditions. These polypeptides or polymucleotides are conditions. These polypeptides or polymucleotides are conditionally useful for diagnosing, treating or preventing call proliferative disorders (e.g. cancers including adenocarcinoma, proliferative disorders (e.g. cancers including adenocarcinoma, cleakaemia, lymphoma, melanoma, myeloma or sarcoma), anaemia, Crohn's cleakaemia, lymphoma, melanoma, myeloma or sarcoma), anoemia, Crohn's cleakaemia, lymphoma, osteoporosis, thrombocytopaenia, psoriasis or hepatitis. ABU11450-ABU11845 represent the MDDT polymucleotides encoded cy ABU11450-ABU11845, described in the disclosure of the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the wipo.int/pub/published_pct_sequences

Human protein sequence SEQ ID NO:15921

```
The invention relates to human cytoskeleton-associated polypeptides

(CYSKP) and their associated polymucleotide sequences. The sequences are useful in the treatment of disorders associated with overexpression or underexpression of CYSKP in a patient. The disorders include cell

conditionally an expectation of CYSKP in a patient. The disorders include cell

conditionally conditionally concern as asthma, atherosciences, arteriosclerosis, crohn's disease, rheumatoid arthritis, diabetes mellitus

conteoporosis, crohren's disease, neurological disorders (such as epilepsy, stroke, cerebral neoplasms, Alzheimer's disease,

cond other motor neuron disorders), cell motility disorders, reproductive disorders (such as endometriosis and polycystic ovary syndrome), muscle disorders (such as myocarditis, migraine, hypertension, hypoglycaemia, myocardial infarction, epilepsy and muscular disorders (such as pown syndrome and cerebral palsy) and mental disorders (such as anxiety and schizophrenia).

conteoporosis and mental disorders (such as anxiety and schizophrenia).
                                                                                        Kearney L;
                                                                                                                                                                                                                                New cytoskeleton-associated proteins and polynucleotides, useful for diagnosing, preventing and treating cell proliferative, autoimmune, inflammatory, neurological, cell motility, reproductive and muscle

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM0136 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.

Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins AABS9111 - AABS9128. The DNA and protein sequences are graculated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and ABES9129 which are used in the invention are sequences AAF22032 - AAF22040 and ABES9129 which are used in the cancer and ovarian cancer associated DNA, protein, agonist cor antagonist sequences exhibit cyrcatatic; immunosuppressive; noctropic; or antagonist sequences exhibit cyrcatatic; immunosuppressive; noctropic; cor antipidiammatory; anticuler; vulnerary; anticorvulsant; anticiabetic; antifungal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly correst and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's classes, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; cardiovascular disorders such as cerebral anoxia and epilepsy; and
                                                                                                        Breast and ovarian cancer associated antigen protein sequence SEQ ID 617.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human breast and ovarian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and disgnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases.

cantingfammatory, anabolic, hypertensive, endocrine-Gen, gastrointestinal-Gen, neuroprotective, endocrine-Gen, gastrointestinal-Gen, neuroprotective, endocrine-Gen, antipatkinsonian, antiarthritic, antiasthmatic, nortropic, antipatkinsonian, antiarthritic, antiasthmatic, antipatcing as immunosuppressive, antiseborrheic or dermatological activity acting as tyrosine ligase modulators. In addition, the disclosed sequences may be useful for gene therapy. The BGS-42 polypeptide or polymucleotide can be used for diagnosing a pathological condition or a susceptibility to a pathological condition, such as a disorder related to aberrant tubulin ligase activity, a disorder related to aberrant tubulin carboxypeptidase activity, a berrant cellular proliferation, reproductive disorders, testicular disorders, testicular cancer, plumonary disorders, lung cancer, gastrointestinal disorders, or proliferation, reproductive certical disorders, brain cancer, or proliferative condition of the testis, lung, small intestine, brain or lymph fissue. The BGS-42 polypeptide, polymucleotide, or their modulators are also useful for treating infertility, Cushing's syndrome, emphysema, pneumonia, Addison's disease, acromegaly, Alaheimer's disease, or Parkinson's disease. The BGS-42 polypeptide can be used as a preventive agent for immunological disease or scleroderma. The antibodies may be used to purify, detect and target the BGS-42 polypeptides. The present sequence is that of the human control sequence does not appear in the specification but was obtained from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 IDGLRNIWIIKPAAKSRGRDIVCMDRVEEILELAAADHPLSRDNKWVQKYIETPLLICD 120

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), processed DNA sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       54 SVNPQTDIDGLRNIWIIKPAAKSRGRDIVCMDRVEEILELAAADHPLSRDNKWVVQKYIE 113

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
